## **Abstract**

In today's fast-changing business environment, it's extremely important to be able to respond to client needs in the most effective and timely manner. If your customers wish to see your business online and have instant access to your products or services. Online Shopping is a lifestyle e-commerce web application, which retails various fashion and lifestyle products. This project allows viewing various products available enables registered users to purchase desired products instantly using PayPal payment processor (Instant Pay) and also can place order by using Cash on Delivery (Pay Later) option. This project provides an easy access to Administrators and Managers to view orders placed using Pay Later and Instant Pay options. In order to develop an e-commerce website, a number of Technologies must be studied and understood. These include multi-tiered architecture, server and client-side scripting techniques, implementation technologies. This is a project with the objective to develop a basic website where a consumer is provided with a shopping cart application and also to know about the technologies used to develop such an application.

## **Introduction**

E-commerce is fast gaining ground as an accepted and used business paradigm. More and more business houses are implementing web sites providing functionality for performing commercial transactions over the web. It is reasonable to say that the process of shopping on the web is becoming commonplace. The objective of this project is to develop a general purpose e-commerce store where product like clothes can be bought from the comfort of home through the Internet. An online store is a virtual store on the Internet where customers can browse the catalog and select products of interest. The selected items may be collected in a shopping cart. At checkout time, the items in the shopping cart will be presented as an order. At that time, more information will be needed to complete the transaction. Usually, the customer will be asked to fill or select a billing address, a shipping address, a shipping option, and payment information such as credit card number. An e-mail notification is sent to the customer as soon as the order is placed.

## **Pros of online shopping website**

### **❖ Convenience**

- The greatest benefit of online shopping is its convenience. Through the digital space, you can buy anything you want from the comfort of your own home. Since online stores are open 24/7 and accessible from anywhere with internet access, it's easy to fit online shopping into your life no matter how busy you are. You don't have to plan your purchases based on when a brick-and-mortar store is open and available to serve you.

### ❖ **Greater Selection**

- Because products online live within the digital space, online retailers are not restricted to shelves and often have more inventory on hand with a wider selection of products. Also, online shopping gives you the chance to buy anything from any retailer, no matter where you're located. If you're in the market for a new lamp, for example, you'll have more options available to you than you would if you only shopped at stores in your local area.

### ❖ **Easy Access to Information**

- When shopping online, you will often find more details about a business's products than you would get in physical stores. Instead of speaking to just one or two sales associates in person, you can peruse product descriptions, recommendations of similar products, and reviews from other shoppers online that may help you make a more informed purchasing decision.

## **Cons of online shopping website**

### ❖ **Can Be More Expensive**

- Online purchases can cost you more for several reasons. Even though many major online retailers offer free shipping, they generally require you meet a minimum to qualify for it. In addition, online retailers may use several strategies to encourage you to buy more items or more expensive items than if you were shopping in person.

### ❖ **Increases Risk of Fraud**

- Unfortunately, online shopping scams do exist. According to the Federal Trade Commission (FTC), online shopping was the second most common fraud category for consumers. Some scammers pretend to be legitimate online sellers with fake websites or create fake ads on real sites.
- Always pay by credit card rather than a debit card, as you can easily report fraud to your credit card company. Also, it is best to avoid online sellers that only accept payment via money transfers, gift cards, or cryptocurrency. Scammers may encourage you to pay through these methods so they can access your money faster.

### ❖ **Leads to Longer Wait Times**

- When you shop at a brick-and-mortar store, you can walk away with the product you bought and use or wear it right away. Online shopping forces you to wait days, weeks, or even longer for your order to arrive. If you're in a time crunch and need a product right away, such as a gift, going to an in-person shop may be a better option for you.

## **A short summary of tools used**

- For frontend, we are using HTML, CSS, bootstrap and JavaScript. **HTML** is the standard markup language for documents designed to be displayed in a web browser. It can be assisted by technologies such as Cascading Style Sheets (CSS) and scripting languages such as JavaScript.

- **Cascading Style Sheets (CSS)** is a style sheet language used for describing the presentation of a document written in a markup language such as HTML. CSS is a cornerstone technology of the World Wide Web, alongside HTML and JavaScript.
- **Bootstrap** is a free and open-source CSS framework directed at responsive, mobile-first front-end web development. It contains CSS- and (optionally) JavaScript-based design templates for typography, forms, buttons, navigation, and other interface components. As of August 2021, Bootstrap is the tenth most starred project on GitHub, with over 152,000 stars, behind freeCodeCamp (over 328,000 stars), Vue.js framework, React library, TensorFlow and others.
- **JavaScript** often abbreviated as **JS**, is a programming language that conforms to the ECMAScript specification. JavaScript is high-level, often just-in-time compiled and multi-paradigm. It has dynamic typing, prototype-based object-orientation and first-class functions.
- For backend we are using PHP and MySQL. **PHP** is a general-purpose scripting language geared toward web development. PHP code is usually processed on a web server by a PHP interpreter implemented as a module, a daemon or as a Common Gateway Interface (CGI) executable. On a web server, the result of the interpreted and executed PHP code – which may be any type of data, such as generated HTML or binary image data – would form the whole or part of an HTTP response. Various web template systems, web content management systems, and web frameworks exist which can be employed to orchestrate or facilitate the generation of that response.
- **MySQL** has stand-alone clients that allow users to interact directly with a MySQL database using SQL, but more often, MySQL is used with other programs to implement applications that need relational database capability.

Code from <https://meesho.com/>

## Proposed model

### Home page

We have designed the layout of the home page using bootstrap. There are boxes and by clicking on them, we will be redirected to the page where the products are displayed. On top right corner, there is an option for sign in or login.

### Sign up page

In the signup page, we have six fields: *name*, *email id*, *password*, *contact number*, *city* and *address*. The *name* should not contain any numbers or special characters. In *email id*, the id should contain some string (alphabet, numerical or special character) then @ sign with the domain after which .(full stop) should come ending with com. For *password*, it should be at least 6 characters long. The *contact number* should be 10 digit long with only digits between

0-9. The *city* and *address* should have string of characters in them. All these conditions are fulfilled by using **regular expression in PHP**.

### Login page

In the login page, we have two fields: *email id* and *password*. The email id entered should already be in the database through the signup page. If it is not there in the database, then an alert will come stating that either the password or the email id is wrong. The user should then go and register to the website. There is also a link in the form which will take you to the registration form if you are not already registered.

### Setting Page

In the setting page, we have the option to change the password of our login. There are three fields: *old password*, *new password* and *re-type new password*. When we want to change the password, we type in the old password and then make a new password. For verification purpose, we re-type the password and click on change button. After clicking the change button, the password will be changed in the database.

### Main page after login

After we login, we are redirected to the page which has all the products that the website is trying to sell. There is an option to add the items in the cart. When we click on the “Add to cart”, the item is added to the cart. We can add an item to the cart only once.

### Cart

In this page, the item number, item name and price are displayed in a tabular form. In the last row, the total amount to be paid is displayed. If we remove an item from the cart, the total also changes. There is an option to “Confirm Order”.

### Logout page

In the logout page, when we logout of the website a page would appear telling the user that they have logged out of the website. A link would come for the user to login again if the user wants to do so. When the user clicks on the link, they would be redirected to the login page.

## Implementation

### *Bootstrap-theme.css*

## Output

### Home page

## Sign up page

The image shows the sign-up page of 'Wishers Stop'. The header is identical to the homepage, with 'Wishers Stop' and 'Sign Up'/'Login' links. The main content area has a heading 'SIGN UP' in bold. Below the heading is a form with six input fields: 'Name', 'Email', 'Password(min. 6 characters)', 'Contact', 'City', and 'Address'. At the bottom of the form is a blue 'Sign Up' button. The footer is a dark bar with the text 'Copyright © Wishers Stop Store. All Rights Reserved.'.

## Conclusion

The Internet has become a major resource in modern business, thus electronic shopping has gained significance not only from the entrepreneur's but also from the customer's point of view. For the entrepreneur, electronic shopping generates new business opportunities and for the customer, it makes comparative shopping possible. As per a survey, most consumers of online stores are impulsive and usually make a decision to stay on a site within the first few seconds. "Website design is like a shop interior". If the shop looks poor or like hundreds of other shops the customer is most likely to skip to the other site. Hence we have designed the project to provide the user with easy navigation, retrieval of data and necessary feedback as much as possible. In this project, the user is provided with an ecommerce web site that can be used to buy things online.
